Sunrays Aren’t the Only Thing You Can Catch at the Pool

As the temperature climbs, many Americans will flock to the pool to find some relief from the heat. While the cool waters can be refreshing, they could also be contaminated with bacteria that can make you sick. Read on to learn about the three most common illnesses you can catch from spending a day at the pool.

**Cryptosporidium (Crypto for Short)**
Crypto, a chlorine-resistant parasite, is one of the most common culprits for post-pool day illness and causes diarrhea, stomach pain and nausea. Unfortunately, symptoms can last for up to two weeks.

To avoid getting sick, don’t swallow pool water or touch your face until you’ve showered with soap and hot water.

**Pinkeye**
Between the chemicals and other people’s bodily fluids in the pool, it shouldn’t be a surprise that you can catch pinkeye from swimming in a shared pool or hot tub.

To avoid getting this infection, wear well-fitted goggles every time you get into the water.

**Hot Tub Rash**
The warm water in hot tubs causes chlorine to break down quickly, making the chemical ineffective in killing the germ that causes an itchy skin infection that can lead to a bumpy, red rash.

To avoid getting this rash, shower immediately after going into the hot tub and be sure to wash your swimming suit before wearing it again.
Are You Up to Date On Your Immunizations?

Every August, the National Public Health Information Coalition sponsors National Immunization Awareness Month to promote the importance of immunizations at all life stages. Vaccination protects everyone, from infants to the elderly, from serious illnesses and complications of vaccine-preventable diseases.

Being properly vaccinated not only protects you, but everyone else around you, from falling ill with serious illnesses like measles, polio, hepatitis and meningococcal meningitis.

Follow the provided links to learn if you and your loved ones are up to date on the recommended vaccinations for each stage of life:

- **Infants and children (birth to age 6)**
- **Preteens and teens (ages 7-18)**
- **Adults (ages 19 and older)**
- **Pregnancy and vaccines**

For more information on vaccines, or to learn more about what vaccines you may need, click here or talk with your doctor.

**KNOW YOUR VACCINES**

Learn the differences between types of vaccines:

1. **Live attenuated vaccine** – These vaccines use a weakened virus strain to produce an asymptomatic infection in your body to produce a lifelong immunity to the illness.

2. **Inactivated vaccine** – These vaccines use “killed” strains of a bacterial or viral strain to evoke an immune response in your body.

3. **Subunit/conjugate vaccine** – These types of vaccines isolate a specific protein or carbohydrate within a virus or bacteria strain to evoke an immune response in your body.
